3.1 Sinks (12.5 points)

3.1.3 What's the pattern? (2.5 points) The implementation of these sinks is a certain pattern, what is the pattern?

The pattern implemented in the sinks is the Strategy Pattern. This is because there is a common sink interface (ISink) that defines an abstraction, and concrete sink classes (FileSink, ConsoleSink) that implement this interface in different ways.

4.1 Adaptation (15 points)

4.1.2 What's the pattern? (2.5 points) What pattern did you use to implement this functionality?

We used the adapter pattern to implement this functionality because we are making a client-logger-adapter so that the logger from structured-logging can be adapted to the i-logger interface from the client.

4.1.3 What's the principle? (2.5 points) What principle are you adhering to by implementing it like this? Explain.

We are adhering to the Open/Closed Principle because we are not modifying the existing classes. Instead, we extend their functionality by creating an adapter that allows the two incompatible interfaces to work together without changing the original classes.
